

## SPRAY WAX

### AUTOMOTIVE WAX

Spray Wax imparts a wax-like water repellent film when applied to automotive bodies in the rinse operation.

Spray Wax retards rusting and corrosion, particularly on chrome, and requires minimum hand drying as beaded water blows off readily with automobile drying equipment.

Dilute Spray Wax 1 to 10 with water (5 gallons in 50 gallons of water). The resulting feed solution should be metered through a proportioner in the rinse water at approximately 6 to 8 ounces for each 5 to 10 gallons of rinse water used.
